Roll No	23A51A4229
Project Name	Metro Ticket Generating System in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement:

Urban metro networks frequently struggle with handling ticket demand effectively, particularly during rush hours when passenger footfall is at its peak. Commuters are forced to stand in lengthy queues at ticketing counters, resulting in significant delays, frustration, and a decline in overall service quality. Conventional ticketing approaches rely on manual fare computation, paper-based ticket distribution, and high levels of staff involvement.

Furthermore, the lack of a unified digital platform for ticket management creates barriers to delivering a smooth booking experience, monitoring ticket consumption, and evaluating commuter travel behavior. These challenges underline the urgent requirement for an intelligent, easy-to-use, and scalable system capable of streamlining the entire ticketing process and boosting operational productivity.

The proposed Metro Ticket Booking System utilizes the ServiceNow platform to fully automate and digitize the ticketing process. It allows passengers to reserve tickets through an online interface, computes travel fares automatically based on origin and destination stations, issues QR-code-enabled digital tickets, and delivers real-time notifications to users. This approach significantly reduces human intervention, cuts down waiting periods, and greatly improves the day-to-day commuting experience.
